То:	All Pension Actuaries
From:	Faisal Siddiqi, Chair Practice Council
	Mark Mervyn, Chair Committee on Pension Plan Financial Reporting
Date:	November 1, 2017
Subject:	Educational Note Supplement: Guidance for Assumptions for Hypothetical Wind-Up and Solvency Valuations Update – Effective Leatember 30, 2017, and Applicable to Valuations with Effective Datas Petween September 30, 2017 and December 30, 2017

Document 217115

The most recent guidance from the Committee on Lension Plan Financial Reporting (PPFRC) regarding assumptions for hypothetical wind-up and Solvency valuations was provided in the <u>educational note supplement</u> dated August 9, 2017. This guidance applied for valuations with effective dates on and after June 30, 2017 (but no later than December 30, 2017).

The PPFRC has conducted its quarterly review of group annuity pricing conditions as at September 30, 2017 and has determined that a revision to its previous guidance regarding assumptions for hypothetical wird up and solvency valuations is appropriate for valuations with effective dates on or after September 30, 2017 (but no later than December 30, 2017).

Additional information is contained in this educational note supplement. The guidance contained in this educational note supplement is consistent with the <u>preliminary</u> <u>communication</u> dated October 23, 2017.

#### **Due Process**

The Policy on Due Process for the Approval of Guidance Material Other than Standards of Practice and Research Documents was followed in the development of these revisions.

#### **Contact Information**

Questions should be addressed to Mark Mervyn, Chair of the PPFRC, at <u>mark.mervyn@aonhewitt.com</u>.

FS, MM

## **Non-indexed Annuity Proxy**

#### **Previous Guidance**

The most recent guidance from the Committee on Pension Plan Financial Reporting (PPFRC) concluded that for valuations with effective dates on or after June 30, 2017 (but no later than December 30, 2017), an appropriate discount rate for estimating the cost of purchasing a non-indexed group annuity, prior to any adjustment for sub- or super-standard mortality, would be determined as the unadjusted average yield on Government of Canada (GoC) marketable bonds with maturities over 10 years (CANSIM series V39062) increased arithmetically by between 60 to 90 basis points (bps), in conjunction with the 2014 Canadian Pensioners' Mortality Table (CPM2014) combined with mortality improvement scale CPM Improvement Scale B (CPM-B) with no adjustments for sub- or super-standard mortality (CPM2014Proj). The spread above the CANSIM series V39062 would be determined based on the duration of the liabilities expected to be settled through the purchase of a group annuity.

This guidance was based on hypothetical quotes provided by seven insurance companies on illustrative blocks of business using pricing conditions as at lane 30, 2017, supplemented by data from certain actuarial consulting firms on actual group annuity nurchases and bona fide quotations during the second quarter of 2017. Furthermore, a is guidance applied to both immediate and deferred pensions, and also applied regardless or the overall size of the group annuity purchase.

### Analysis

The PPFRC obtained hypothetical quotes and September 30, 2017 from seven insurance companies on the same illustrative blocks of Lusiness used to develop the previous guidance. The characteristics of the three illustrative blocks are as follows:

Duration	Low	Medium	High
Duration at September 30, 017	8.5	11.1	13.5
Approximate premium 2 September 30, 2017	\$18 million	\$24 million	\$25 million
Average monthly pension	\$897	\$897	\$897
Proportion of liability for deferred members	0%	4%	12%

For the purpose of this guidance, the durations of the illustrative blocks shown above were determined by calculating the impact of a 0.01% change in the discount rate, and using the following formula:

[(Estimated Purchase Price at 3.10% / Estimated Purchase Price at 3.11%) – 1] / 0.01%

where 3.10% is equal to the CANSIM V39062 yield of 2.40% at September 30, 2017 plus 70 bps and where the estimated purchase price is calculated using mortality rates equal to the 2014 Canadian Pensioners' Mortality Table (CPM2014) combined with mortality improvement scale CPM Improvement Scale B (CPM-B) with no adjustments for sub- or super-standard mortality (CPM2014Proj), being the guidance for the illustrative block with medium duration (as described below). Note that the durations of the three illustrative blocks will change over time as discount rates change.

The PPFRC also obtained data from certain actuarial consulting firms on actual group annuity purchases and bona fide quotations in cases where the transaction did not proceed during the third quarter of 2017.

The hypothetical quotations at June 30, 2017 and September 30, 2017 may be summarized as follows:

Average of the Three Most Competitive Hypothetical Quotes (Using CPM2014Proj Mortality Tables)						
June 30, 2017 September 30, 2017				2017		
	Low	Medium	High	Low	Medium	High
	duration	duration	duration	duration	<b>d</b> vation	duration
Discount rate	2.65%	2.82%	2.84%	2,957	3 09%	3.17%
Spread over CANSIM V39062	+ 58 bps	+ 75 bps	+ 77 bps	+ 55 ops	+ 69 bps	+ 77 bps

The spread over CANSIM V39062 based on the average of the taske most competitive hypothetical quotes decreased at the low and medice durations and was flat at the high duration. As of September 30, 2017, the variability between the most competitive hypothetical quotes was small, decreasing since the previous quarter at the short and medium durations but increasing at the high duration. In addition, the average spreads for actual purchases and bona fide quotations during the quarter wavegenerally more favourable than the averages quoted above at all durations, though there were limited data at the low and high durations.

Based on the above information, the PPER has concluded that a revision to the guidance is appropriate. In establishing the guidance, the PPERC has given some weight to the hypothetical quotes and to the data collected on actual annuity purchases and bona fide quotations.

## Guidance for Non-ind xed Pensions

The PPFRC has conclude that effective September 30, 2017, the cost of purchasing nonindexed annuities, prior to any adjustment for sub- or super-standard mortality, would be estimated based on the following process:

- 1. Determine the duration of the portion of the liabilities assumed to be settled through the purchase of annuities, based on a discount rate of 3.10% (CANSIM V39062 plus 70 bps at September 30, 2017) and CPM2014Proj mortality rates.
- 2. Using the duration obtained in step 1, interpolate using the following table to determine the appropriate spread above unadjusted CANSIM V39062:

Illustrative block	Duration based on 3.10% discount rate	Spread above unadjusted CANSIM V39062
Low duration	8.5	+ 60 bps
Medium duration	11.1	+ 70 bps
High duration	13.5	+ 80 bps

If the duration of the portion of the liabilities assumed to be settled through the purchase of annuities is lower than 8.5 or higher than 13.5, the actuary would make a reasonable assumption regarding the appropriate spread.

The PPFRC believes that groups with durations higher than 13.5 would likely include a large proportion of deferred vested members. While the higher duration, in isolation, would be expected to result in lower pricing, the PPFRC believes that this impact would be offset by added administrative costs and risks that insurers would incur in assuming these obligations. The PPFRC also believes that it is rare the agoup would have a duration materially lower than 8.5. A few actual purchase with lower durations were observed last quarter providing some preliminary indication that the pricing of actual purchases with significantly lower duration than 8 may be inconsistent with the pricing information collected for the low duration hypothetical quotes. The PPFRC concluded then that there was insufficient data to introduce efine ents to the guidance for these very low durations. There were no actual purchase. with lower durations observed this quarter, however the PPFRC will continue monitor actual purchases and bona fide quotes of very low durations and may collect additional data to determine if a refinement to the guidance is wanneed in the future. As of September 30, 2017, the PPFRC believes that one reas proach would be to assume that the spread for mable a durations lower than 8.5 is 60 bps, no the spread for durations higher than 13.5 is +80 bps. Other approaches so be/ easonable. ay`

3. The cost of purchasing an uities would be estimated using an interest rate determined as the unadjusted CAR alM V39062 increased arithmetically by the spread calculated in step 2, in conjunction who CPM2014Proj.

The above guidance applies to valuations with effective dates on and after September 30, 2017, up to December 30, 2017, pending any further guidance or other evidence of change in annuity pricing.

## **CPI-Indexed Annuity Proxy**

### **Previous Guidance**

The most recent guidance from the PPFRC concluded that for valuations with effective dates on or after June 30, 2017 (but no later than December 30, 2017), an appropriate discount rate for estimating the cost of purchasing a group annuity where pensions are fully indexed to the rate of change in the Consumer Price Index (CPI) would be the unadjusted yield on Government of Canada real-return long-term bonds (CANSIM series V39057) reduced arithmetically by 70 bps, in conjunction with CPM2014Proj.

### Analysis

A subset of the contributing insurers also provided hypothetical quotes for the illustrative blocks on a CPI-indexed basis as of September 30, 2017, three of which indicated they may be willing to transact on their hypothetical quotes. The hypothetical quotations as at June 30, 2017 and September 30, 2017, for the medium-duration illustrative block where insurers indicated that they may be willing to transact on their hypothetic hypothetical quotes may be summarized as follows:

Average of the Most Competitive Hypothetical Quotes (Using CPM2014Proj Mortality Tables)				
	June 30, 2017	September 30, 2017		
Number of hypothetical				
quotes in the average	3	3		
Discount rate	- 0.29%	0.01%		
Spread over CANSIM V39057	- 87 bps	83 bps		

Based on the average of the three hypothetical quotes, the spreads below the unadjusted yield on Government of Canada real-return long-term bonds (CANSIM V39057) for the mediumduration illustrative block decreased during the quarter. The absolute value of the spread on the low and high duration blocks were both higher than fourthe medium duration block. In addition, significant variation between the hypothetical quotes was observed, and the variability increased since the previous quarter

While there is some indication that the price of CPI-indexed annuities may also vary by duration, the PPFRC has concluded that there are insufficient data at this stage to introduce this level of refinement. Consequently, we guid not contained herein is applicable to CPI-indexed annuities regardless of their duration.

The PPFRC was provided with no applicable quantitative data on actual fully- or partiallyindexed annuity purchases or or bona fide quotations in cases where the transaction did not proceed during the third graner of 2017.

### Guidance for Fully CPI-In lexed Pensions

Based on the pricing received, the PPFRC has concluded there is insufficient data to warrant a revision to the previous guidance, and that an appropriate proxy for estimating the cost of purchasing a group annuity where pensions are fully indexed to the rate of change in the CPI, prior to any adjustment for sub- or super-standard mortality, would be determined using an interest rate equal to the unadjusted yield on Government of Canada real-return long-term bonds (CANSIM series V39057) reduced arithmetically by 70 bps, in conjunction with CPM2014Proj.

The above guidance applies to valuations with effective dates on and after September 30, 2017, up to December 30, 2017, pending any further guidance or other evidence of change in annuity pricing.

#### Example

As at September 30, 2017, the unadjusted yield on Government of Canada real-return longterm bonds (CANSIM series V39057) was 0.82%. Therefore, an applicable underlying discount rate would be determined as 0.82% - 0.70% = 0.12%.

#### **Partially-Indexed Annuities**

In situations where pensions are partially indexed, indexed to a measure other than the CPI, or contain a deferred component, the actuary would make appropriate provisions for such situations consistent with the guidance provided in the annual educational note dated March 1, 2017, modified to reflect the revised guidance contained in this memo.

## Validity of March 1, 2017 Educational Note

Except as noted above, actuaries would continue to reference the march 1, 2017 <u>educational</u> <u>note</u> for guidance with respect to the selection of assumptions for hypothetical wind-up and solvency valuations with effective dates between December 31, 2017 and December 30, 2017. In particular, the educational note continues to apply with respect to the following:

- Rounding of the interest rate resulting from following the juidance;
- Application to both immediate and deferret pensions and the overall size of the group annuity purchase;
- Mortality basis, which remains the 2014 Combined Canadian Pensioners' Mortality Table (CPM2014) in conjunction with the CPM Improvement Scale B (CPM-B) with no mortality adjustments (CPM2014Proce and
- Mortality adjustments, where there is comonstrated substandard or super-standard mortality or where an insure might be expected to assume significantly shorter or longer-than-average, lenson previous ongevity.

## Actual Annuity Pricing

The purpose of this earcas hal note supplement is to provide actuaries with guidance related to establishing assumptions for hypothetical wind-up and solvency valuations. The pricing for an actual group annuity purchase depends on many factors, with the result that the actual price may differ from the guidance provided herein. In addition to the duration of the purchase and the factors outlined in the section of the March 1, 2017 educational note titled "Mortality Adjustments", some of the other factors that may affect pricing of a particular purchase include, but are not limited to, the following:

- The overall size of the purchase;
- The proportion of deferred vested members included in the group being purchased;
- Broad capital market conditions at the time of the purchase; and
- Competitive pressures in the group annuity market at the time of the purchase.

## **Retroactive Application**

If an actuary has already prepared a funding valuation report with an effective date on or after September 30, 2017, before the publication of this guidance, the actuary would consider paragraphs 1820.30 through 1820.36 of the Standards of Practice to determine whether it is necessary to withdraw or amend the report.

## **Additional Comments**

The PPFRC intends to continue monitoring group annuity pricing on a quarterly basis. Actuaries may use the spreads indicated above for valuations with effective dates on and after September 30, 2017, up to December 30, 2017, pending any future guidance or other evidence of change in annuity pricing.

As part of this quarterly review, the PPFRC requested information from insurers as to whether an illustrative block of business that is half the size or five times the size but keeping the same average pension and profile as the current illustrative block, would have asignificant impact on price. Based on the information collected, the PPFRC does not currently believe that the guidance should be revised to reflect differing pricing for these modified blocks.

It may be noted that the spreads versus GoC long-term bonds for a oup annuity pricing have been volatile during the past three to four years. Actuarie may wish to be mindful of this volatility when communicating advice related to acture according the top of the volume and solvency valuations.

## Appendix A – Summary and Links for Historical Guidance

The following is a summary of the historical guidance issued by the PPFRC. The summary is provided for reference, and actuaries are directed to refer to the respective published educational note or educational note supplement.

Educational		Non-indexed Immediate and Deferred Duration: Spread relative to unadjusted CANSIM V39062			Fully CPI-Indexed Spread relative to unadjusted CANSIM V39057
Note/		Low	Medium	High	
Supplement	Mortality table <sup>1</sup>	duration	duration	duration	All durations
